Best Answer: Okay, so you've balanced the equation, which is the first step, and you've calculated the number of moles of each reactant. I didn't check your math, but using the numbers you've provided, you now have to find the limiting reactant (which I suspect is  $\text{NiSO}_4$ ). To do this, calculate how many ...

Stoichiometry is the calculation of the quantities of sub-stances involved in chemical reactions. In solution stoichiometry, volumes of solutions are measured and quantities calculated using the molarities of the solutions. Chemical analysis often uses the accurately known molarity of a solution to determine the quantity of a substance pres-

solving these solution stoichiometry problems is to set up the problem so that the units cancel. When the volume of a solution is multiplied by the molarity of a solution the resulting units are moles. A balanced equation allows us to convert from moles of a known substance to moles of an unknown.
