Classical mechanics describes the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies.. If the present state of an object is known it is possible to predict by the laws of classical mechanics how it will move in the future (determinism) and how it has moved in the past (reversibility).

3.2.6 Physical Interpretation of elastic constants for isotropic solids . It is important to have a feel for the physical significance of the two elastic constants E and ν . Young's modulus E is the slope of the stress strain curve in uniaxial tension. It has dimensions of stress (N/m^2) and is usually large for steel, . You can think of E as a measure of the stiffness of the solid.
