An $n \times n$ complex matrix A is called positive definite if $\text{Re}[x^*Ax] > 0$ (1) for all nonzero complex vectors x in C^n , where x^* denotes the conjugate transpose of the vector x . In the case of a real matrix A , equation (1) reduces to $x^T Ax > 0$, (2) where x^T denotes the transpose. Positive definite matrices are of both theoretical and computational importance in a wide variety of applications.

Until the 19th century, linear algebra was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and conceptually simpler, although more abstract. A vector space over a field F (often the field of the real numbers ...

Electrical resistivity (also called specific electrical resistance or volume resistivity) and its converse, electrical conductivity, is a fundamental property of a material that quantifies how strongly it resists or conducts the flow of electric current. A low resistivity indicates a material that readily allows the flow of electric current. Resistivity is commonly represented by the Greek letter
