Before we describe the solution of these equations, let's discuss the word linear. To say that an equation is linear is to say that if we have any two solutions  $y_1(x)$  and  $y_2(x)$  of the equation, then  $c_1y_1(x) + c_2y_2(x)$  is also a solution of the equation, where  $c_1$  and  $c_2$  are any two constants (in other

words, the set of solutions forms a vector space).

Thus the analysis component of 'numerical analysis' is essential. We rely on tools of classical real analysis, such as continuity, differentiability, Taylor expansion, and convergence of sequences and series. Matrix computations play a fundamental role in numerical analysis. Discretization of continuous variables turns calculus into algebra.
