Stirling Engines

Four basic steps in the cycle of a free-piston Stirling engine are: The power piston is pushed outwards by the expanding gas thus doing work. The gas volume in the engine increases and therefore the pressure reduces,... The reduced pressure now arrests the outward motion of the piston and it ...

Stirling engine - Wikipedia

The gasses used inside a Stirling engine never leave the engine. There are no exhaust valves that vent high-pressure gasses, as in a gasoline or diesel engine,... The Stirling cycle uses an external heat source, which could be anything from gasoline to solar energy to the heat produced by decaying ...

How Stirling Engines Work | HowStuffWorks

Stirling engines don't have an exhaust (from inside the engine) because the working gas is used again and again in every cycle. Of course, Stirling engines can be heated by flame heaters (or any other form of heat). If the Stirling engine is designed to use flames to heat the hot side, the heater will certainly have an exhaust.

American Stirling Company | All About Stirling Engines

How Stirling Engines Work. The Stirling engine only makes power during the first part of the cycle. There are two main ways to increase the power output of a Stirling cycle: Increase power output in stage one - In part one of the cycle, the pressure of the heated gas pushing against the piston performs work.
